Ever walked into a mall and saw heaps of people gathered into lines that stretch as far as the eye could see? You have no idea what’s going on, but for some inextricable reason you feel compelled to join the back of the line too and patiently await for this mysterious artefact to reveal itself. Hopefully something or someone turns up?

If you did, you just succumbed to the lure of the herd and fallen into perhaps one of the most common investor behavioural biases. Most daily examples of herding behaviour can be completely innocuous whether you’re strolling through your neighbourhood mall or adopting the latest trends. But as seen throughout history, extreme instances of herding in markets can significantly distort prices, lead to asset bubbles and even cause recessions.

From Tulipmania that gripped 17th century Netherlands, the dotcom bubble in the early 2000s as well as the subprime mortgage crisis during the 2008-GFC, history has shown that investors are willing to suspend disbelief when market euphoria swells to reach delirious highs. This is prevalent especially during bullish market conditions and when there is abundant liquidity in the system.

Go with the Flow? Not Really...

As social creatures, people have a sense of safety in numbers. There is just a collective reassurance that comes with conforming to the wisdom of the crowd especially when navigating the treacherous peaks and slopes of markets.

But if you take a closer at just who is behind the trading desk, you may realise that that there’s isn’t anyone after all. The underlying reality of investing in stock markets today is that most trading are done by machine and algo traders who profit from short-term fluctuation in prices and ignore fundamental analysis. According to reports, 80% of daily moves in the US stock market are machine-led. In 2017, the global algorithmic trading market was valued at US$ 9,297.24 million and is projected to exhibit compound annual growth rate (CAGR) of 10.1% over the forecast period (2018 - 2026)(1).

Behind each market plunge is a digital herd of trading bots programmed to buy and sell based on pre-determined formulas and models. This ignites a ‘flash crash’ like that seen in 2010 when the Dow Jones Index lost close to 1,000 points in mere minutes. The S&P 500, Dow Jones Industrial average and Nasdaq collectively lost $1 trillion. But in 36 minutes, the rout was all over and markets rapidly recouped back its losses.

Investors who reacted too quickly and sold into this correction would see their portfolios impacted and dragged down by this invisible digital herd. Most daily price fluctuations are just too fast and short-term in nature for any ‘human’ investor to discern any meaningful price trend/movement and make gains.

It’s also primarily a volume game for algo traders that rely on high frequency trading to make razor-thin margins. Indirectly, the proliferation of machine trading has exacerbated intraday volatility and lead to sudden spikes in markets.
Recognising Bad Behavior

Detecting herd-like behaviour in markets can be tricky for investors. By its nature, the market is dominated by emotions of greed and fear which tend to take over logical reasoning and critical judgement. Thus, investors who follow the herd tend to buy high and sell low historically.

Chart 1 below shows the performance of the S&P 500 index against equity fund flows through the years. When the S&P 500 index soared during the dotcom boom in 1999, there was also an influx of equity fund flows leading investors to a market that is already frothy and potentially overvalued. Conversely, when the markets fell after the housing bubble burst in 2009, there was a surge of outflows when investors cashed out from the market, but selling low.

Chart 1: Herd Behaviour Leads to Bad Judgement

Timing the market is a precarious errand and your chances of missing the best days in markets can sting more than avoiding the worst days. Some of the biggest upswings often occur during a market swoon when investors have already fled.

Chart 2: Better To Do Nothing

A Case of FOMO

Just like life, investors have the tendency to join the bandwagon due to just a case of FOMO (i.e., Fear of Missing Out) and burying their own consternations. A recent example would be the height of the bitcoin currency craze that sent prices to dizzying highs above its intrinsic value, if there ever was.

A stute investor Warren Buffet said that one should be, “Fearful when others are greedy and be greedy when others are fearful.” Take a step away from the herd and put on your contrarian cap to understand what is driving the euphoria in markets.

Have a long-term investment horizon in mind and understand your own risk-tolerance and liquidity needs. If you can’t stomach the volatility in your portfolio, chances are you may be taking too much risk than your capacity allows. As long you have properly done your asset allocation and are adequately diversified in your portfolio, you can confidently sit through market cycles and ride through the turbulence.
